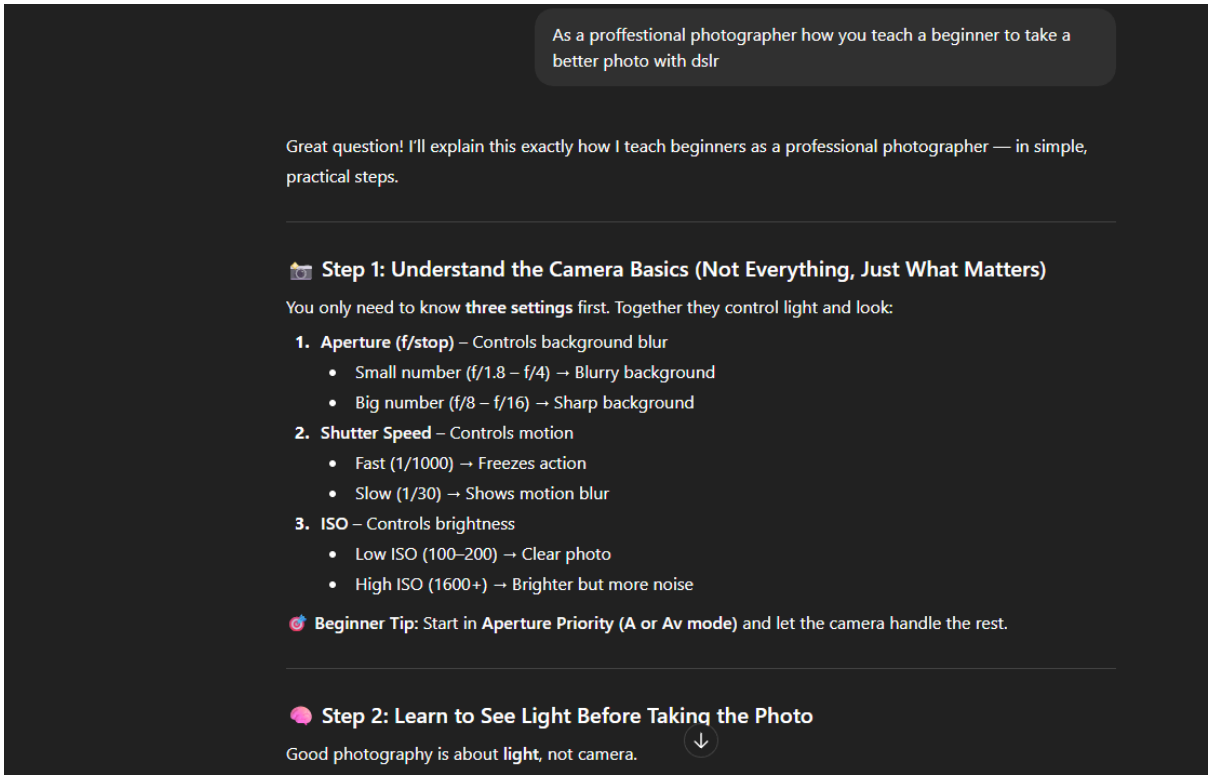
Objective: To master foundational patterns that control the persona, logic, and refinement of Large Language Model (LLM) outputs.

1. **Persona Prompting**

• Concept: Instructing the AI to adopt a specific identity (e.g., "Act as a senior software engineer") to influence the tone and expertise of the response.

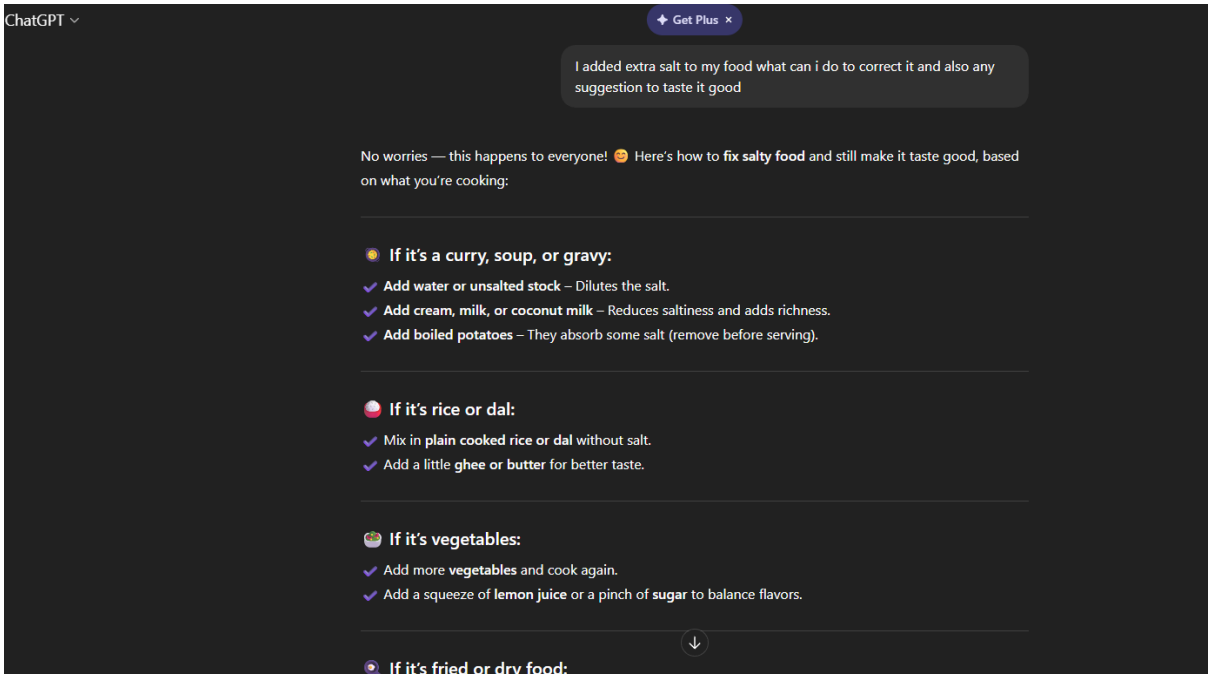
• Instruction: Start your prompt by defining who the AI should be before giving the task.



2. **Cognitive Verifier Pattern**

• Concept: This pattern forces the AI to break down a complex question into smaller, verifiable sub-questions to ensure accuracy before providing a final answer.

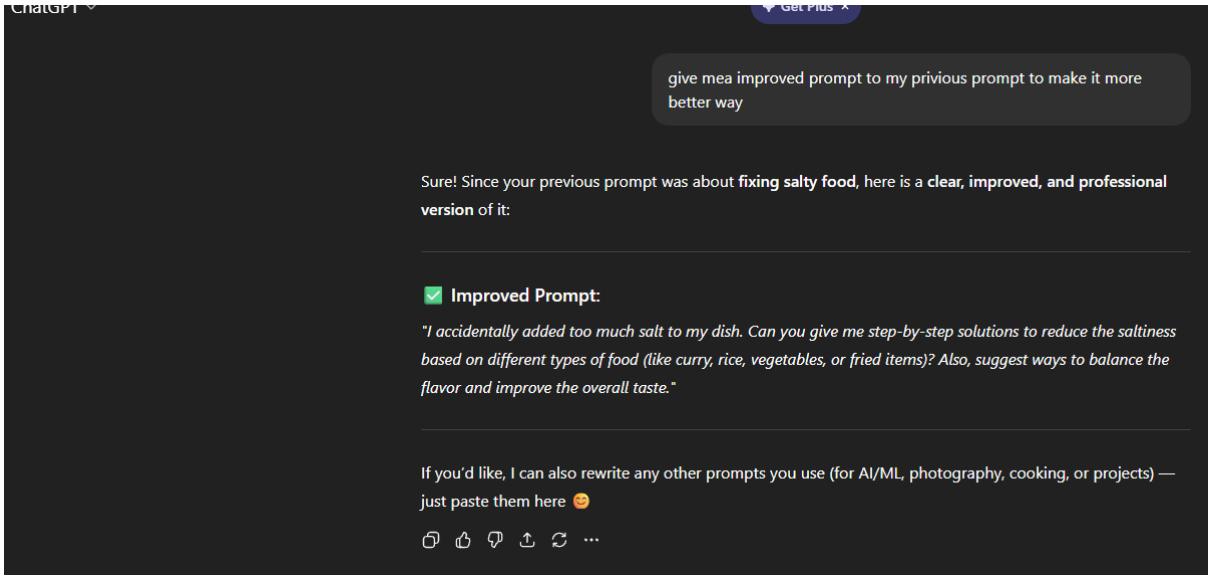
• Instruction: Ask the AI to identify what additional information it needs or what sub-questions must be answered to solve your main query.



3. **Question Refinement Pattern**

• Concept: Requesting the AI to improve the user's prompt.

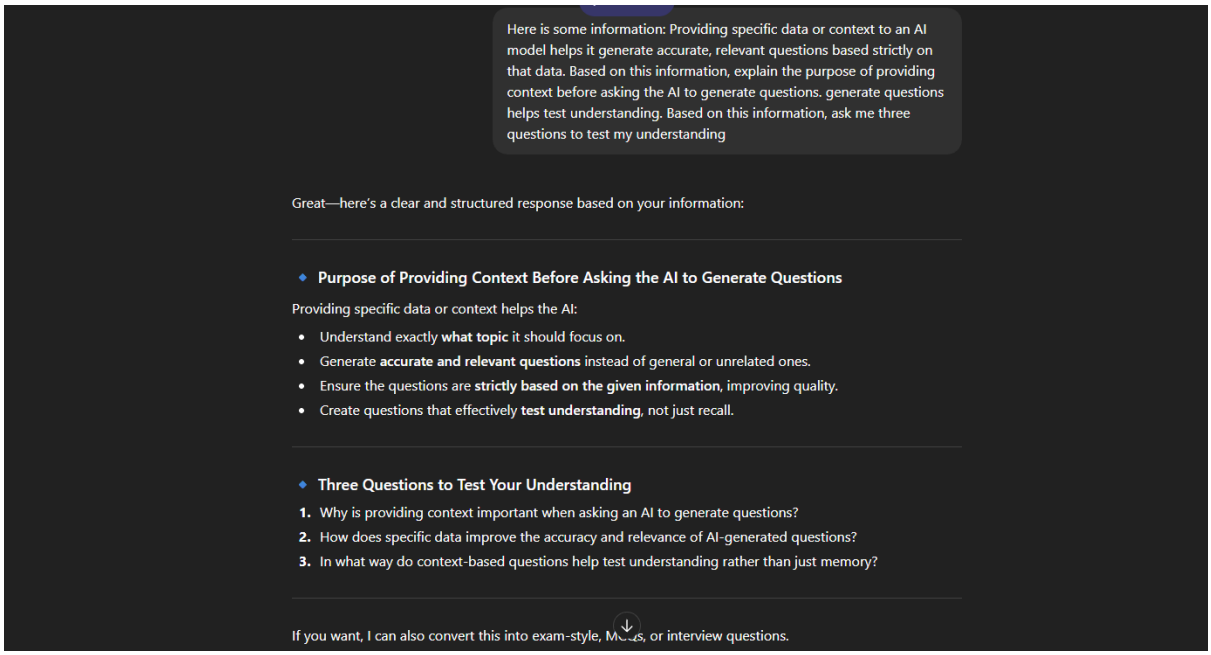
• Instruction: After providing a prompt, ask the AI: "Suggest a better version of this question to get a more accurate result."



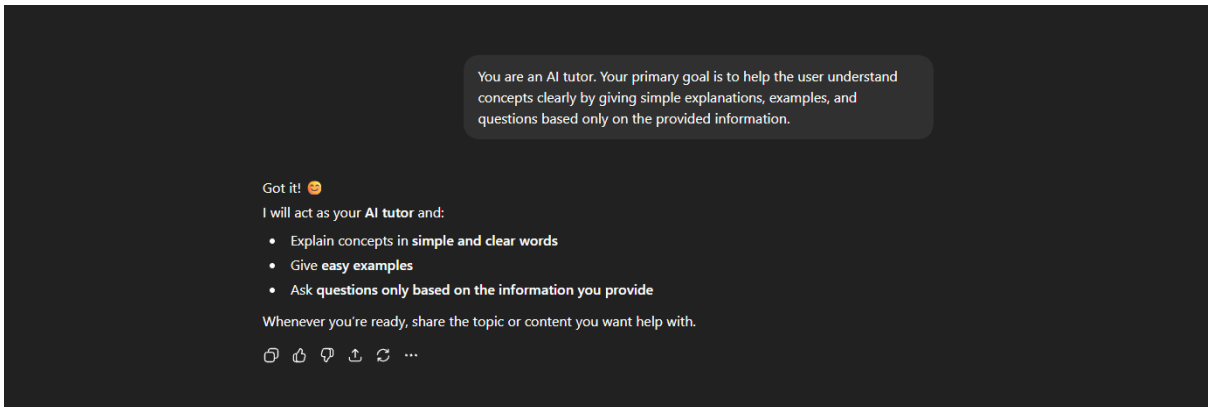
4. **Provide New Information and Ask Questions**

• Concept: Feeding specific data or context to the model and then instructing it to generate questions or insights based strictly on that data.

• Instruction: Paste a text segment and command the AI to: "Based on this information, ask me three questions to test my understanding."



5. **Root Prompt**

• Concept: Establishing the primary, overarching instruction that sets the boundaries for the entire conversation.


• Instruction: Clearly define the primary goal at the start of the session to keep the AI focused.
